Technology Business Review

REB Architects, Pllc

February 18, 2026

Your technology. No surprises.

MFA COVERAGE	PATCH COMPLIANCE	DEVICES NEEDING REPLACEMENT	LINGERING TICKETS (30+ DAYS)
92%	100%	2	1

Operational Readiness

Are day-to-day operations running smoothly?

⚠ 1 user(s) without MFA (92% covered)

copier

⚠ 1 request(s) open 30+ days

86 total requests in 6 months

Infrastructure & Capacity

Is the hardware ready for what's ahead?

23 devices managed (8 Win Laptop, 11 Win Desktop, 4 Server)

⚠ 2 device(s) aging out or past end of life

⚠ 2 device(s) running unsupported OS

DESKTOP-IG09SF3 (Windows 10 Home Premium Edition), KELLY-BOXX-LT (Windows 10 Professional Edition)

✓ Patch compliance at 100%

Financial Efficiency

Are technology investments being used wisely?

Microsoft 365 License Cleanup Opportunity

We identified **20 unused licenses** that can be removed or reallocated. By cleaning these up, you would save approximately **$80/month** ($960/year).

LICENSE	IN USE	TOTAL	UNUSED	SAVINGS/MO
Microsoft Teams Audio Conferencing with dial-out to USA/CAN	8	28	20	$80

Recommended Next Steps

Prioritized actions to keep your environment healthy

Executive Summary

Your technology foundation is in good shape — all devices are current, security tools are deployed, and your team is generally well-protected. However, there are two critical areas that need attention soon: one user account lacks password protection (making it an easy entry point for attackers), and your server infrastructure

account lacks password protection (making it an easy entry point for attackers), and your server infrastructure is approaching the end of its useful life. Your engineer has flagged the servers as needing replacement this year to avoid unexpected downtime, and we have a few security upgrades that will significantly reduce your exposure to modern cyber threats.

Enable MFA for the copier account — ACT NOW

If that password is stolen or guessed, an attacker has direct access to your systems with no additional barriers. Enabling multi-factor authentication for this account closes that door and ensures 100% coverage across your organization. This is the single most effective step you can take to prevent a breach.

Address the pending security incident — ACT NOW

Leaving security incidents unresolved can allow threats to persist or escalate. Closing this out ensures nothing is lingering in the background that could cause problems later.

Replace or update two devices running unsupported Windows versions — ACT NOW

Unsupported operating systems don't receive critical security patches, leaving those machines — and your network — vulnerable to known exploits. Replacing or upgrading these devices eliminates that risk.

Complete security training for all users and improve phishing test results — ACT NOW

Employees are often the first line of defense against cyberattacks. If staff aren't trained to recognize threats, your business is at higher risk of a costly breach, ransomware attack, or data loss. Getting everyone trained and improving awareness will significantly reduce your exposure.

Plan server replacement and modernize backup infrastructure — PLAN FOR

Aging servers increase the risk of unexpected hardware failure, which could mean hours or days of downtime, lost billable time, and expensive emergency replacements. Proactively replacing your servers and moving to a modern backup solution (Veeam with onsite storage) ensures business continuity and protects your data. This is something to budget for and schedule within the next few months to avoid surprises.

Implement Active Directory and cloud account synchronization — PLAN FOR

Synchronizing your directories streamlines user management, reduces the chance of mistakes, and makes it easier to enforce consistent security policies across all systems. This also lays the groundwork for more advanced security features.

Upgrade 9 users to Microsoft 365 Business Premium and strengthen email security — PLAN FOR

Upgrading to Business Premium unlocks stronger identity protection (including phishing-resistant multi-factor authentication) and allows us to migrate your email security to Microsoft Defender for Office 365, which provides better threat detection and simpler management. This reduces your risk of account takeovers, email compromise, and other identity-based attacks that are increasingly common.

Remove unused licenses to reduce wasted spending — CONSIDER

Removing these unused licenses is an easy way to reduce recurring costs without impacting any services your team actually uses. We can always add them back later if needed.

Appendix

Computers & Users

23 Managed Computers
